Optical lens design is the process of designing a lens to meet a set of performance requirements and constraints, including cost and manufacturing limitations. Parameters include surface profile types, as well as radius of curvature, distance to the next surface,

material type and optionally tilt and decenter. The process is computationally intensive, using ray tracing or other techniques to model how the lens affects light that passes through it.

its design. A camera lens features symmetrical optics and is produced with the same shape over and over again. This is a rare exception in the field of eyeglass lenses, where asymmetry is the rule. The lens shape is considerably more complex and is unique for every single lens.
