In probability, statistics and related fields, a Poisson point process is a type of random mathematical object that consists of points randomly located on a mathematical space. The Poisson point process is often called simply the Poisson process, but it is also called a Poisson random measure, Poisson random point field or Poisson point field.

For this, It \hat{o} used, as a fundamental tool, the notion of Poisson point processes formed of all excursions of the process on $S \setminus \{a\}$. This theory of It \hat{o} 's of Poisson point processes of excursions is indeed a breakthrough. It has been expanded and applied to more general extension

"Poisson Point Processes provides an overview of non-homogeneous and multidimensional Poisson point processes and their numerous applications. Readers will find constructive mathematical tools and applications ranging from emission and transmission computed tomography to multiple target tracking and distributed sensor detection, written from an engineering perspective.

random measures in order to define the Poisson point process. The last part of this chapter concerns to subordinators and their connection with the Levy-Kinchine formula. 1. Poisson point processes 1.1.

Poisson point processes and subordinators. A Poisson Process is a model for a series of discrete event where the average time between events is known, but the exact timing of events is random. The arrival of an event is independent of the event before (waiting time between events is memoryless).

A point process X in the window W has density f with respect to the unit rate Poisson process if $E[h(X)] = E[h(Y)f(Y)]$ (1) for all functionals h , where Y is a unit rate Poisson process (i.e. $\lambda = 1$). In particular

Spatial point processes: Theory and practice illustrated ...

The simplest and most ubiquitous example of a point process is the Poisson point process, which is a spatial generalisation of the Poisson process. A Poisson (counting) process on the line can be characterised by two properties : the number of points (or events) in disjoint intervals are independent and have a Poisson distribution. A Poisson point process can also be defined using these two properties.

When N is Poisson point process, the conditional intensity function $\lambda(t)$ depends only on information about the current time, but not on history $H(u)$. Poisson point process is neither self-exciting nor self-regulating.
